

SMSTC Prospectus 2021-22

Welcome to the Scottish Mathematical Sciences Training Centre. This document gives a brief overview for students and their supervisors of what SMSTC offers. We hope that it will be useful to you in planning the first few months of your PhD – and beyond!

SMSTC modules fall into two categories. **Core modules** are offered every year, and are formally assessed. **Supplementary modules** may change from year to year, and they may or may not be assessed. Supplementary modules are not necessarily more advanced than core modules, but often deal with a special topic of current research interest. All SMSTC students are welcome to attend both core and supplementary modules.

What we offer is designed to be flexible. SMSTC allows students to enrol in as many or as few modules as they like, in the first year or in later years of their PhDs; and to enrol in any module without taking the assessments. (However, many departments do have more specific requirements, so students are advised to discuss their choice of modules with their supervisors.) Students often gain most from taking a mixture of modules that relate directly to their research interests and modules that will **broaden their mathematical knowledge** in other areas – the latter may be more challenging, but also rewarding!

How, what, and when

SMSTC lectures are delivered by **video conference using Zoom**; departments provide local tutorial support, which is not co-ordinated by SMSTC. Lecture notes and other material may be found on our **website**, www.smstc.ac.uk. To access this material, students will need to **register** with SMSTC and then **enrol** for each module; instructions can be found on the front page of the site.

The SMSTC year begins with the **online opening symposium**, which will be held on Wednesday 29 September 2021. The symposium will include overviews of the modules, as well as sessions dealing with practical topics (such as how to get a PhD) and opportunities to meet your fellow students. We intend to follow this with two **further symposia** later in the year, one of which will focus on research skills and the other of which will give an introduction to teaching university mathematics. We will provide further details of these events once the likely Covid restrictions become clearer.

Semester 1 runs from Monday 4 October 2021 to Friday 10 December 2021, and **Semester 2** runs from Monday 10 January 2022 to Friday 18 March 2022.

Each core module will be assessed by one or more **assignments**. The deadline for the final assignment is typically two or three weeks after the end of the semester, and we aim to return grades a few weeks after that. Letters will be issued to students in late May confirming the modules that they have taken and the grades they have received.

More information about the structure of SMSTC and the **content of the modules** is available on the website. Please see especially the SMSTC Information for Students page,

<https://www.smstc.ac.uk/information/students>

Modules available in 2021-22

Core modules

The sixteen core modules are organised on four themes: Analysis [ANA]; Applications of Mathematics [AOM]; Probability and Statistics [PAS]; Structure and Symmetry [SAS]. The lectures for the core modules take place in the afternoons, Monday through Thursday, throughout each semester (see the timetable on the SMSTC website). The titles of the core modules and their themes are as follows. *[The corresponding titles prior to 2017-18 are in italics.]*

Semester 1

Groups, Rings and Modules [SAS]	<i>[Algebra 1]</i>
Dynamical Systems and Conservation Laws [ANA]	<i>[Applied Analysis and PDEs 1]</i>
Asymptotic and Analytical Methods [AOM]	<i>[Applied Mathematics Methods 1]</i>
Algebraic Topology [SAS]	<i>[Geometry and Topology 1]</i>
Continuum Mechanics [AOM]	<i>[Mathematical Models 1]</i>
Foundations of Probability [PAS]	<i>[Probability 1]</i>
Measure and Integration [ANA]	<i>[Pure Analysis 1]</i>
Regression and Simulation Methods [PAS]	<i>[Statistics 1]</i>

Semester 2

Algebras and Representation Theory [SAS]	<i>[Algebra 2]</i>
Elliptic and Parabolic PDEs [ANA]	<i>[Applied Analysis and PDEs 2]</i>
Numerical Methods [AOM]	<i>[Applied Mathematics Methods 2]</i>
Manifolds [SAS]	<i>[Geometry and Topology 2]</i>
Mathematical Biology and Physiology [AOM]	<i>[Mathematical Models 2]</i>
Stochastic Processes [PAS]	<i>[Probability 2]</i>
Functional Analysis [ANA]	<i>[Pure Analysis 2]</i>
Modern Regression and Bayesian Methods [PAS]	<i>[Statistics 2]</i>

Supplementary modules

In 2021-22 we plan to offer the following supplementary modules. Lectures will take place in the mornings, Monday through Thursday, throughout each semester. However, some modules may not use the full ten weeks (see the detailed timetable on the SMSTC website).

Note that supplementary modules are not necessarily assessed, so if you need to take a module for credit then you should check the module page (and ask the lecturer if necessary).

Semester 1

Calculus of Variations and Dynamics
Fourier and Harmonic Analysis
Geometry of Gauge Fields

Semester 2

Classical and Quantum Integrable Systems
Formal Groups
Introduction to Geometric Group Theory
Stochastic Networks and Processes
Advanced Methods for Stochastic Sampling (not yet confirmed)
Fluid Dynamics (not yet confirmed)

Which modules are suitable for me?

Every student taking SMSTC will have a different academic background and interests, so modules are not labelled as “introductory” or “advanced”. The following list of expected prior knowledge should give you an idea of where each module starts relative to what you've already studied. Before making any choices, though, you should also look at the syllabus (see the module page on the website) and if possible attend the symposium where you will be able to speak to the module leader.

Core modules: expected prior knowledge

Algebraic Topology. A working knowledge of metric and topological spaces; linear algebra (vector spaces, linear maps and quotient vector spaces); group theory (groups and group actions).

Algebras and Representation Theory. The notion of a module and related concepts; basics on Noetherian and Artinian modules; some commutative algebra, in particular the notion of a principal ideal domain.

Asymptotic and Analytical Methods. Basic ODEs (first-order separable and first- and second-order linear equations); single- and multivariable calculus; Taylor's theorem; linear algebra; contour integration including Cauchy's theorem.

Continuum Mechanics. Introductory courses on ODEs, PDEs, vector calculus and basic linear algebra.

Dynamical Systems and Conservation Laws. Undergraduate-level ODEs, single- and multivariable real analysis, and linear algebra.

Elliptic and Parabolic PDEs. Undergraduate-level ODEs, single- and multivariable real analysis, and linear algebra.

Foundations of Probability. Elements of mathematical analysis, linear algebra and combinatorics at undergraduate level.

Functional Analysis. Undergraduate analysis: sequences, series, pointwise and uniform convergence. Metric space topology: at least in \mathbb{R}^d , continuity of functions, open, closed and compact sets. Countable sets. Some of the examples draw upon the measure theory from “Measure and Integration”.

Groups, Rings and Modules. Basic linear algebra; definitions and examples of groups, rings, fields; basic algebra concepts such as homomorphisms; basic notions of group theory – permutations, symmetric groups, Lagrange's theorem, normal subgroups and factor groups.

Manifolds. A working knowledge of metric spaces; linear algebra (vector spaces, linear maps and quotient vector spaces); group theory (groups and group actions); vector calculus (differentiable map, Jacobian matrix and div/grad/curl); topological spaces and continuous functions; the fundamental group; covering spaces; the classification of surfaces; homology.

Mathematical Biology and Physiology. Undergraduate-level knowledge of ODEs, PDEs, vector calculus and basic linear algebra.

Measure and Integration. Undergraduate analysis: sequences, series, pointwise and uniform convergence. Metric space topology: at least in \mathbb{R}^d , continuity of functions, open, closed and compact sets. Countable sets.

Modern Regression and Bayesian Methods. SMSTC “Regression and Simulation Methods” or equivalent.

Numerical Methods. Basic ODEs (in particular first order separable and first- and second-order linear equations); single- and multivariable calculus; Taylor's theorem; and linear algebra. This module involves coding; prior knowledge of Matlab or Octave would be helpful, and students who do not have prior experience of a programming language should be aware that they will need to learn one.

Regression and Simulation Methods. Basic concepts in: probability (elementary probability distributions); statistics (ideas of estimation, confidence intervals, hypothesis tests); calculus. The level required in these areas would usually be provided in a first undergraduate course.

Stochastic Processes. Elements of mathematical analysis, linear algebra and combinatorics at undergraduate level. Probability theory, either at undergraduate level or from SMSTC "Foundations of Probability".

Supplementary modules: expected prior knowledge

Advanced Methods for Stochastic Sampling (not yet confirmed): TBC.

Calculus of Variations and Dynamics. Some knowledge of Sobolev spaces and elementary functional analysis would be an advantage.

Classical and Quantum Integrable Systems. Some familiarity with manifolds and differential calculus on manifolds; groups and group actions. Lie groups and Lie algebras will also be needed, but the necessary material will be reviewed in the first lecture.

Fluid Dynamics (not yet confirmed): TBC.

Formal Groups. The basics of group and ring theory as covered in an undergrad course in abstract algebra. Helpful but not necessary knowledge (which will be covered in the module) includes: (a) some practice with p-adic numbers, power series and completions; (b) some basic knowledge on categories, functors (and the Yoneda lemma); (c) some knowledge of division algebras, at the level of SMSTC "Algebras and Representation Theory"; (d) some pre-requisite knowledge of Lie.

Fourier and Harmonic Analysis. Fundamentals of mathematical analysis and several variable calculus, as covered in typical undergraduate mathematics degree. A modest background in higher topics in analysis would be useful, such as functional analysis and measure theory on \mathbb{R}^n . In particular, students should ideally have had some prior exposure to L^p spaces and the notion of a bounded linear operator between these spaces.

Geometry of Gauge Fields. Students taking this course should have some background in geometry and topology (definition of a manifold) and group theory, but no knowledge of Lie groups or gauge theory will be assumed.

Introduction to Geometric Group Theory. This module will be accessible to anyone having taken a standard abstract algebra course at undergraduate level or SMSTC "Groups, Rings & Fields". A familiarity with algebraic topology or differential geometry (as in SMSTC "Algebraic Topology" and "Manifolds") is not required, but students with this background will be able to study additional examples connecting to their own research.

Stochastic Networks and Processes. SMSTC "Foundations of Probability" or equivalent.
